ARRAY STACKING

SEM Supporter

Recording

SEM Array Recorder
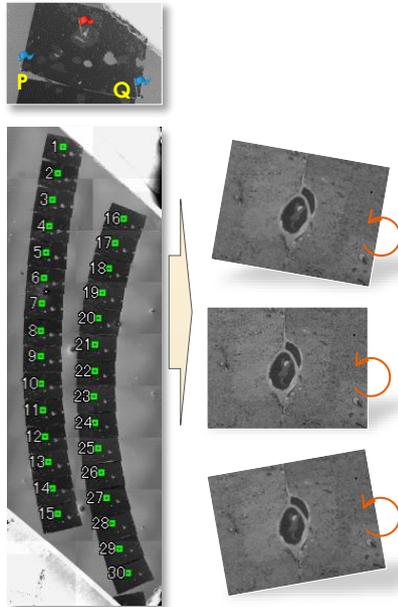

Step 1
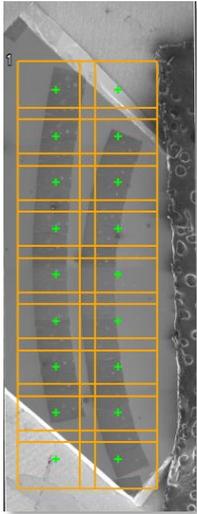

**Wide area**

Collect a montage of the entire sample.

Step 2

Sections at low magnification

Take images for each section with the same orientation using Individual alignment points.

Step 3

model image

Take images of all sections

Matching

Cell at high magnification

Take images for the region of interest with the same orientation as the model image with auto scan rotation.

CLEM
Correlative Light Electron Microscopy

Link coordinates from OM image for navigation in the SEM with simple P-Q alignment.

Images with observation conditions

Motorized Stage

OM

Alignment points

Move the stage position to the observation points after setting the alignment.

Stack N Viz

3D Reconstruction

StackerNEO

StackerNEO is the application software that reconstructs the sliced images systematically obtained.

In Array Tomography, the observation target can slightly rotate.
StackerNEO corrects this rotation and aligns based on a feature matching algorithm.

3D Visualization

Visualizer-evo

The Visualizer-evo includes volume rendering, multi-slicing, isosurface plotting, volume segmentation, and movie maker tools with a variety of 3D volume representation and 3D measurement options (length, angle, etc.).

Colorist

Segmentation

Region of Interest Extraction Software

Colorist allows selection and colorization of multiple regions of interest to form 3D volume images with the intuitive user interface.

Segmentation refers to a function that extracts arbitrary regions of interest (organization and structure) from Volume data.

Difference with Visualizer-evo
A volume segmentation function is included in Visualizer-evo, which is suitable for extracting single defined features very quickly. Colorist makes it possible to extract multiple independent regions of interest and ideal for volumes containing many different features.
